

Valley Corridor

Zitat von Just Trains

Valley Corridor Route for Train Simulator is a fictional mountain route that runs between two large cities, both of which sit on plateaus. The route is used for stopping and express passenger runs as well by freight trains. There are numerous lakes below the route, making it a very scenic and spectacular route to drive. Its maximum line speed is 125 MPH, which is applicable towards its southern end.

In the central section of this overhead electrified route is a spectacular S-shaped section where the track weaves around two peaks.

Valley Corridor Route features 16 stations, most with freight yards, and has numerous custom assets. The route is [Quick Drive](#) enabled and comes with 20 Standard scenarios giving you the option of driving with default Train Simulator stock or or add-on DLC stock.

Important! If you purchased Train Simulator after 20th September 2012 you will require the [European Loco & Asset Pack](#) (available to purchase via Steam) for the route to display correctly.

Route features
